

DC-1 DISPLAY

STEALTH
ELECTRIC BIKES

Introducing Stealth's latest family addition, the DC-1. Built by Stealth riders for Stealth riders, the DC-1's innovative design compliments every adventure on a new Stealth bike.

With its new large screen graphical display, important information such as battery level, power consumption and speed, can be read at a glance.

Range anxiety is a thing of the past. The DC-1 is now able to make real time estimates of your remaining range based on your riding habits.

Intuitive icons and simplified menus allow for easy navigation through improved features such as:

- Smoother speed & power limiting
- 2 Trip meters
- Trip time
- Range estimator
- System diagnostics
- 24 hour clock
- Ride efficiency
- Average speed
- Maximum power
- Brake regen recovered
- Odometer
- Back light control
- Sound on/off

With the push of a button, you now have a choice of 2 new throttle maps. A smooth, efficient Street curve; or crisper, more aggressive Off-Road curve.

When the battery is running low and you're not quite home yet, the low battery warning alarm sounds to let you know that the all new, E-mode has kicked in to more efficiently manage the remaining power. Warmer, harsher conditions are managed by the DC-1's advanced temperature control system, which sets off an audible warning and adjusts the useable power if on-board temperatures become critical. So if you are busy concentrating on what's in front of you, the DC-1 is taking care of your powertrain.

Wet and muddy conditions are no problem with the DC-1 which combines a weatherproof housing with a new replaceable overlay, making it tough, durable and user friendly.... Just like our bikes.
